## Probability Theory

Probability Function:

- $0 \leq P \leq 1$
- $P(S) = 1$
- $E_1 \cap E_2 = \emptyset \implies P(E_1 \cup E_2) = P(E_1) + P(E_2)$
- $P(E_1) + P(E_2) = P(E_1 \cup E_2) + P(E_1 \cap E_2)$

Conditional Probability:

$$P(E|F) = \frac{P(E \cap F)}{P(F)}$$

Two events are said to be independent if:

$$P(E \cap F) = P(E)P(F)$$

**Theorem 1.** Let  $F_1, F_2, \dots, F_n$  be a partition of the sample space  $S$ . Assume  $F_i \cap F_j = \emptyset$  for any  $i \neq j$ . Then for any event  $E \subset S$ ,

1.  $P(E) = \sum_i^n P(E|F_i)P(F_i)$
2.  $P(F_j|E) = \frac{P(E|F_j)P(F_j)}{\sum_i^n P(E|F_i)P(F_i)}$  (Bayes' Formula)

## Random Variables

Memory-less Property:

$$P(X > m + n | X > n) = P(X > m)$$

Expectation Value:

$$\langle X \rangle = \sum_{i=0}^{\infty} x_i p(X = x_i) = \sum_{i=0}^{\infty} x_i p(x_i)$$

$$\langle X \rangle = \int_{-\infty}^{\infty} x f(x) dx$$

Cumulative Distribution Function:

$$F(x) = \int_{-\infty}^x f(t) dt$$

Law of the Unconscious Statistician:

$$\langle g(X) \rangle = \int_{-\infty}^{\infty} g(x) f(x) dx$$

Linearity of Expectation:

$$\langle aX + b \rangle = a \langle X \rangle + b$$

Moments:

$$n\text{-th moment of } X = \begin{cases} \int_{-\infty}^{\infty} x^n f(x) dx \\ \sum_i^n x_i^n p(x_i) \end{cases}$$

Variance:

$$\text{Var}(X) = \langle (X - \langle X \rangle)^2 \rangle = \langle X^2 \rangle - \langle X \rangle^2$$

Joint Continuity:

$$P((X, Y) \in C) = \iint_C f(x, y) dx dy$$

Marginal Distribution:

$$P(X \in A) = P(X \in A, Y \in \mathbb{R}) = \int_A \int_{-\infty}^{\infty} f(x, y) dy dx$$

Independence:

If  $X, Y$  are independent, then

$$P(X \leq a, Y \leq b) = P(X \leq a)P(Y \leq b)$$

$$\langle g(X)h(Y) \rangle = \langle g(X) \rangle \langle h(Y) \rangle$$

Covariance:

$$\text{Cov}(X, Y) = \langle (X - \langle X \rangle)(Y - \langle Y \rangle) \rangle = \langle XY \rangle - \langle X \rangle \langle Y \rangle$$

Correlation Coefficient:

$$\rho(X, Y) = \frac{\text{Cov}(X, Y)}{\sqrt{\text{Var}(X)\text{Var}(Y)}} \in [-1, 1]$$

Cauchy-Swartz Inequality:

$$|\langle XY \rangle|^2 \leq \langle X^2 \rangle \langle Y^2 \rangle$$

Sum of Random Variables:

$$\text{Var}(X + Y) = \text{Var}(X) + \text{Var}(Y) + 2\text{Cov}(X, Y)$$

$$F_{X+Y}(a) = P(X + Y \leq a) =$$

$$\int_{-\infty}^{\infty} \int_{-\infty}^{a-y} f_{X+Y}(x, y) dx dy = \int_{-\infty}^{\infty} f_X(a-y) f_Y(y) dy$$

Conditional Probability Distribution:

$$f_{X|Y}(x|y) = \frac{f_{X,Y}(x, y)}{f_Y(y)}$$

Conditional Expectation:

$$\langle X|Y \rangle = \sum_x x p_{X|Y}(x, y)$$

$$\langle X|Y \rangle = \int_{-\infty}^{\infty} x f_{X|Y}(x, y) dx$$

$$\langle X \rangle = \langle \langle X|Y \rangle \rangle = \sum_y \langle X|Y = y \rangle P(Y = y)$$

$$\langle X \rangle = \langle \langle X|Y \rangle \rangle = \int_{-\infty}^{\infty} \langle X|Y = y \rangle f_Y(y) dy$$

## Characteristic Functions

$$\phi_X(t) = \langle e^{itX} \rangle \quad M(t) = \langle e^{tX} \rangle$$

$$\text{Extracting Moments: } \frac{d^n}{dt^n} \phi(t) \big|_{t=0} = \langle i^n X^n \rangle$$

Inversion Theorem:

$$f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \phi(t) e^{-itx} dt$$

Shifting:

$$\phi_{aX+b}(t) = e^{itb} \phi_X(at)$$

## Convergence of Random Variables

Convergence in Distribution:

$$\lim_{n \rightarrow \infty} F_n(x) = F(x) \quad \forall x \text{ cont.} \iff X_n \xrightarrow{D} X$$

**Thm (Continuity Theorem):**

Let  $X_1, X_2, \dots$  be random variables with CDFs  $F_1, F_2, \dots$  and characteristics functions  $\phi_1, \phi_2, \dots$ . Then

· If  $F_n \rightarrow F$ , where  $F$  is the CDF of some random variable  $X$ , then  $\lim_{n \rightarrow \infty} \phi_n(t) = \phi(t)$ .

· If  $\lim_{n \rightarrow \infty} \phi_n(t) = \phi(t)$  and  $\phi(t)$  is continuous at  $t = 0$ , then  $\phi$  is the characteristic function of some random variable  $X$  and  $F_n \rightarrow X$  and  $X_n \xrightarrow{D} X$ .

**Thm (Weak Law of Large Numbers):** Let  $X_1, X_2, \dots, X_n$  be iid random variables. Assume  $\langle X \rangle = \mu < \infty$ . Let

$$S_n = \sum_{i=1}^n X_i. \text{ Then } \frac{S_n}{n} \xrightarrow{D} \mu.$$

**Thm (Central Limit Theorem):** Let  $X_i$  be iid random variables. Let  $\langle X_i \rangle = \mu < \infty$ ,  $\text{Var}(X_i) = \sigma^2 < \infty$ , and  $S_n = \sum_{i=1}^n X_i$ . Then

$$\frac{S_n - n\mu}{\sigma\sqrt{n}} \xrightarrow{D} N(0, 1).$$

## Statistical Estimation

**Def (Estimator):** A function of the data that is used to estimate the unknown parameter.

Estimator of the mean  $\mu$ :

$$\text{Sample Mean } \bar{X} = \frac{1}{n} \sum_{i=1}^n X_i$$

Estimator of the variance  $\sigma^2$ :

$$\text{Sample Variance } S^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2$$

**Def (Confidence Interval):** For some interval  $A \subset \mathbb{R}$ , an estimator is in the  $a\%$  confidence level if  $P(\bar{X} \in A) = a\%$ .

## Random Walks

**Symmetric random walks in  $\mathbb{Z}^d$ :**

Number of visits to the origin  $M$ :  $\langle M \rangle = (1 - u)^{-1}$ .

Probability walk returns to the origin  $u = 1 - 1/\langle M \rangle$ .

If  $u = 1$ , the walk is recurrent, otherwise transient.

## Markov Chains

Transition Matrix  $P$ : Rows add to 1.

One-Step Transition Probability:

$$P_{ij} = P(X_{n+1} = j | X_n = i) \quad \sum_j P_{ij} = 1$$

N-Step Transition Probability:

$$P^n = P(X_{l+n} = j | X_l = i)$$

Chapman-Kolmogorov Equation:

$$P_{ij}^{n+m} = \sum_k P_{ik}^n P_{kj}^m$$

$$P^{n+m} = P^n P^m$$

### Classification of States:

- A state  $i$  is absorbing if  $P_{ii} = 1$
- $j$  is accessible from  $i$  if  $P_{ij}^n > 0$  for some  $n$ .
- $i$  and  $j$  communicate ( $i \leftrightarrow j$ ) if  $j$  is accessible from  $i$  and  $i$  is accessible from  $j$ .
- If  $i$  is recurrent and  $j$  is accessible from  $i$ ,  $i \leftrightarrow j$ .
- If  $i$  is recurrent and  $i \leftrightarrow j$ , then  $j$  is also recurrent.

### Irreducibility:

A Markov chain is irreducible if there is only one state (all states communicate).

### Periodicity of state $i$ :

Period  $d = \gcd\{n \geq 1 : P_{ii}^n > 0\}$

$d = 1 \implies i$  is aperiodic

### Transience and Recurrence:

$f_i = P(\exists n \text{ s.t. } X_n = i | X_0 = i)$

$f_i = 1 \implies i$  is recurrent (every path leads to  $i$ )

$f_i < 1 \implies i$  is transient

### Recurrent State for $T_i$ = time of first return to $i$ :

$\langle T_i | X_0 = i \rangle < \infty \implies$  positive recurrent

$\langle T_i | X_0 = i \rangle = \infty \implies$  null recurrent

**Def (Ergodic):** A aperiodic, positive recurrent state is called ergodic. A Markov chain is ergodic if all its states are ergodic.

**Thm (Existence of Equilibrium Distribution):** For an irreducible, ergodic Markov chain, the limit

$$\pi_j = \lim_{n \rightarrow \infty} P_{ij}^n$$

exists for all  $j$  and is independent of state  $i$ .

1.  $\pi$  is the unique solution of  $\pi = \pi P$  and  $\sum_j \pi_j = 1$
2. Let  $N_j(n)$  be the number of visits to state  $j$  after  $n$  steps. Then  $\pi_j = \lim_{n \rightarrow \infty} \frac{N_j(n)}{n}$
3.  $\pi_j = 1/m_j$  where  $m_j = \langle T_j | X_0 = j \rangle$

### Time Reversal:

Given a Markov chain  $(X_n)_{n=0}^N$  with stationary distribution  $\pi$  and with  $P(X_0 = j) = \pi_j$ , let  $Y_n = X_{N-n}$ . Then  $(Y_n)_{n=0}^N$  is a Markov chain with transition probabilities  $Q_{ij} = P_{ji} \frac{\pi_j}{\pi_i}$  and stationary distribution  $\pi$ .

**Def (Time Reversibility):** A markov chain is time reversible if  $Q_{ij} = P_{ij} \forall i, j$ . In this case,  $\pi_i P_{ij} = \pi_j P_{ji}$ .

### Random Variables

Distribution	Mass/Density Function	Mean	Variance	Characteristic Function
Binomial( $n, p$ )	$p(i) = \binom{n}{i} p^i (1-p)^{n-i}$	$np$	$np(1-p)$	$(1-p + e^{it})^n$
Geometric( $p$ )	$p(k) = (1-p)^{k-1} p$	$1/p$	$\frac{1-p}{p^2}$	$\frac{pe^{it}}{1-(1-p)e^{it}}$
Poisson( $\lambda$ )	$p(i) = \frac{\lambda^i}{i!} e^{-\lambda}$	$\lambda$	$\lambda$	$e^{\lambda(e^{it}-1)}$
Uniform( $a, b$ )	$f(x) = \begin{cases} \frac{1}{b-a} & x \in [a, b] \\ 0 & \text{otherwise} \end{cases}$	$\frac{a+b}{2}$	$\frac{(b-a)^2}{12}$	$\frac{e^{ita} - e^{itb}}{it(b-a)}$
Exponential( $\lambda$ )	$f(x) = \begin{cases} \lambda e^{-\lambda x} & x \geq 0 \\ 0 & x < 0 \end{cases}$	$1/\lambda$	$1/\lambda^2$	$\frac{\lambda}{\lambda - it}$
Normal( $\mu, \sigma^2$ )	$f(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$	$\mu$	$\sigma^2$	$e^{i\mu t - \sigma^2 t^2/2}$
